

# Big ideas require big bandwidth.

That's why we built an impressively powerful fiber system that handles massive amounts of data with ease. And we placed it in one of the most future-forward regions in the US.

Where the future is tested in the Columbus Region

The fiber system connects The Beta District with high-speed, low-latency fiber optic cable.

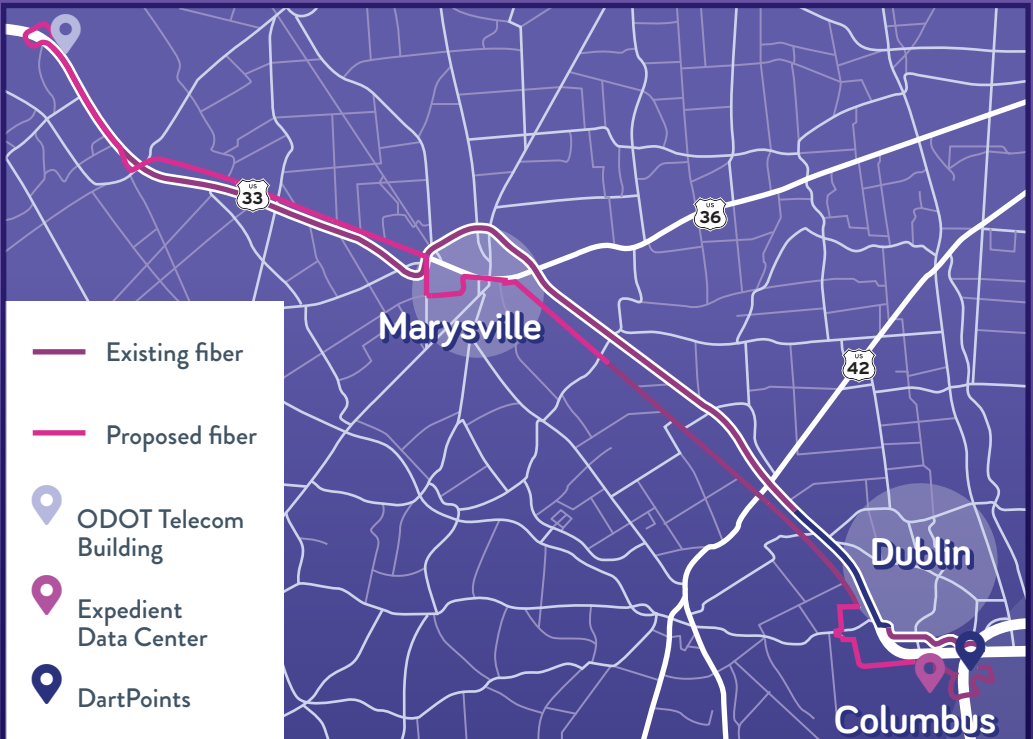

End users enjoy easy access through two data centers, multiple handholds, and a direct line to the OARNet Supercomputer at The Ohio State University (separate agreements required).
